Rapid Manufacturing /
Additive processes

?

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

3D Printing

Principle : using a printhead.

Advantage :

- Can be used in engineering and design depts, in drawing offices, at home

Drawback :

- Fragile parts

Applications :

- Prototyping, design office

Materials :

- Light sensitive resins, epoxy
- Polymer melt
- Polymer binder on polymer, metal, sand, ceramic powders.

Some machine manufacturers :

- Molten polymer thread: Stratasys
- Light sensitive systems : Objet
- Powder + binder system : Prometal.

Dimensions : up to 4 x 2 x 1 metres (Voxeljet, binder jetting)

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

FUSED DEPOSITION MODELING (FDM)

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

Examples

Fused Deposition Modelling (FDM)

Stratasys

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

FUSED DEPOSITION MODELING (FDM)

Advantages :

- Functional and flexible models.
- Soluble supports
- Simple system, possibility of desktop use.
- Non-toxic materials

Machine manufacturer :
Stratasys, USA

- **Materials :**

- **ABS**
- **Polycarbonate**
- **PC-ABS**
- **Elastomer**

Drawbacks :

- Extrudable materials only
- Layer thickness (0.2 mm mini) and wall thickness (0.3 mm mini)
- Precision : +/- 0.15 mm

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

BINDER JETTING ON A POWDER

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

STEREOLITHOGRAPHY (SLA)

Alternative light source :
Digital Light Processing or
DLP® projectors
to project voxel data
(volumetric pixels).

- Molded part with support construction

- Buildup chamber with elevating platform (z)

- Resin container

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

STEREOLITHOGRAPHY (SLA)

3D Systems

Envisiontec

Objet

Examples of models for
investment (« waste
wax ») casting

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

STEREOLITHOGRAPHY

- Materials :
 - light-sensitive epoxy resins .
 - UV-curable flexible or high-T° resins...
- Advantages :
 - + Surface aspect, precision (esp. DLP systems)
 - + Well-known, mature technology
 - + Large volume machines
 - + ...
- Drawbacks :
 - Only light-sensitive resins
 - Supports necessary
 - Quite fragile parts, UV-sensitive
 - Uncontrolled shrinkage

LASER SINTERING

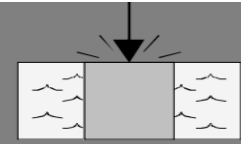

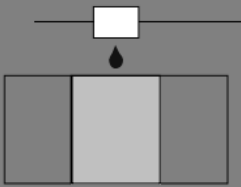

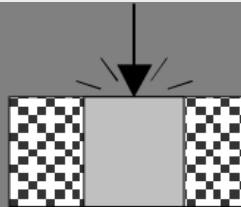

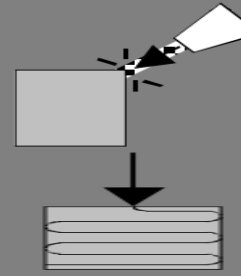

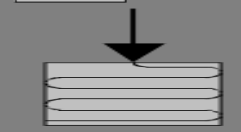

Selective Laser Melting: equivalent of SLS for metal powders

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

Classification of additive processes

Materials to be transformed	Principles of transformation	Technologies	Acronyms	Pictures	Main groups
Photo-Sensitive resin	Photo Polymerization	Laser of UV flashing	SLA STL DLP		Stereo lithography
		Printhead	Polyjet		3D printing
Powder: polymeric, metal, ceramic, sand	Binding	Printhead	3DP		
	Sintering/ fusion	Laser, IR flashing, or electron beam	SLS SLM DMLS EBM SMS		Laser Sintering /Melting
		Projection	DMD		Deposition
Polymer filament	Liquid State "welding"	Deposition	FDM		

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

Product Development: Context and Stakes

Industrial targets:

- Reduction of marketing times
- Decrease of costs
- Quality control(and standards)

Trends:

- Evolution towards small / medium size series, mass customization, increased complexity
- Product lifetime
- Delocalization of large series manufacturing, of mouldmaking industry...
- Need for flexibility and reactivity of production

Important economical stakes

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

COMPARISON OF COSTS

- | | |
|----------------------------------|-------------------------------|
| ⊕ of Development | BUT: |
| ✓ Independent on part complexity | ✓ Limited choice of materials |
| ✓ Fast | ✓ Materials cost |
| ✓ No specific tooling | ✓ Production time |
| | ✓ ... |

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

SLS : on the way to industrial production

Laser Sintering

principle:

- Powder preheating below melting T°
- Spreading of powder layer
- Scanning with CO2 laser (infra-red),
- Particles fusion and « sintering »
- Build tank going down by a layer thickness
- Next layer...

Advantages:

- Self-supporting powder
- Great freedom of shapes,
- Possible assembling and functional systems

Drawbacks:

- Few commercial materials available
- Anisotropy of parts.
- Limited part size

Application field:

- Prototyping, direct part manufacturing, rapid manufacturing.

Main current materials available :

Polyamide 11 or 12 : plain, filled : glass beads,
aluminium, carbon, and/or flame retardant
Polystyrene
PEEK (specific machine, 1 in Germany)

Main machine manufacturers :

EOS GmbH, 3D Systems.

Dimensions : 700 X 380 X 600

ADDITIVE MANUFACTURING PROCESSES FOR POLYMERIC MATERIALS FORMING

Part 2 : Selective sintering
 processes for polymer
 powders

- Analysis of SLS physical mechanisms
- Introducing SMS

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

IDENTIFICATION OF THE KEY MATERIALS PARAMETERS

Prior to sintering, 2 conditions are very important for the process:

Powder **flowability**
Powder **bed density**

Main influent parameters

- Particle size
- Size distribution
- Sphericity

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

DIFFERENT POWDER MORPHOLOGIES

Main influent parameters

- Particle size
- Size distribution
- Sphericity

All of them need SiO_2 as flowability agent (< 1 wt%)

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

IDENTIFICATION OF THE KEY MATERIALS PARAMETERS

Sintering of semi-crystalline polymers

- *Warpage due to shrinkage throughout the crystallization is a key issue*
➡ *Re-crystallization must be controlled*

Powder bed T° maintained in the **processing window** $w : T_m - T_c$

➡ Part warpage (“curling”) avoided

Polyamide 12 mostly used thanks to very wide w range

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

MOST INFLUENT PROCESS PARAMETERS

➤ *Process conditions of first order influence are :*

The heat provided to the powder during the whole fabrication cycle

The energy provided to the polymer material by the laser

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

PROCESS PARAMETERS

- Different temperatures of preheating

PROCESS PARAMETERS

Energy Density ED : a single parameter

$$ED = \frac{P}{\pi r^2} \cdot \frac{2r}{v} \cdot \frac{2r}{s}$$

Power
supply by
surface unit

Number of
exposures

Time of
exposure

The energy supply depends on the:

- Scan spacing (S) via laser beam superimposition
- Laser beam celerity (v)
- Laser radius (r)
- Laser power (P)

CHARACTERIZATION OF MICROSTRUCTURE

1. POROSITY

- By application of Archimedes' principle on samples infiltrated with CH_2I_2
➡ Calculation of open and closed porosities

Evolution of the global porosity (vs. ED):

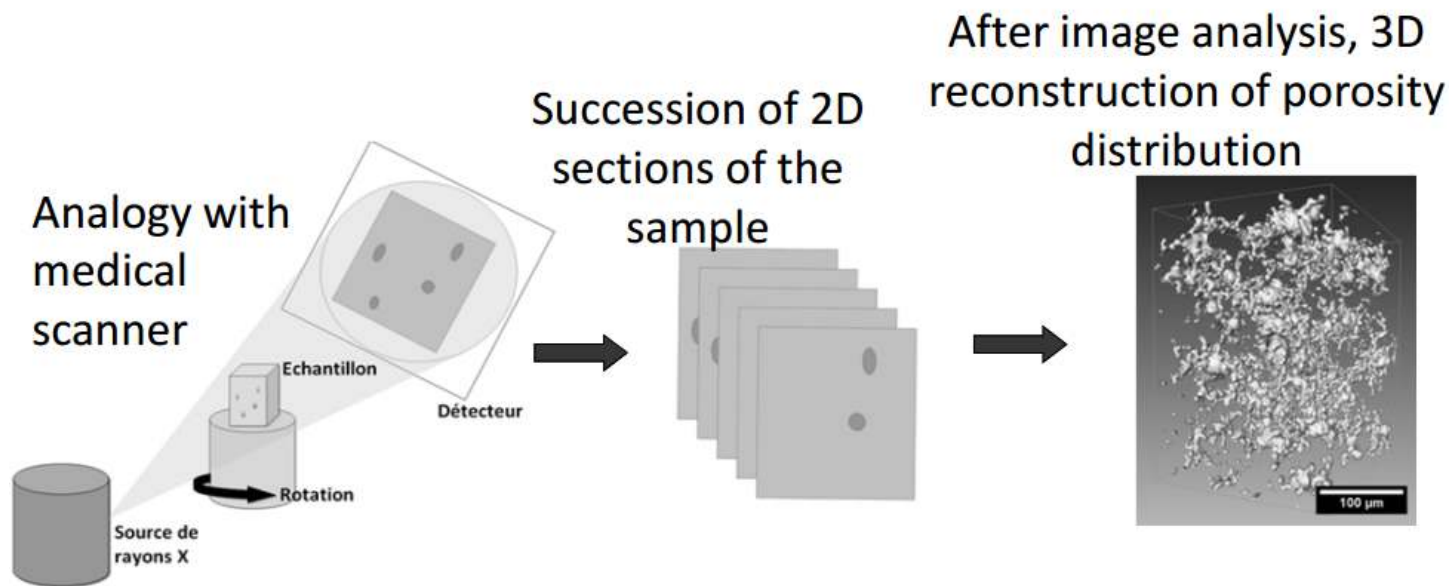

- Porosity decreases when ED increases
- Porosity reaches a minimum value about 2%

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

ENHANCED CHARACTERIZATION OF POROUS MICROSTRUCTURE

- By 3D X-Ray tomography

- ➔ Computation of closed porosity fraction, information on size and spatial distribution of pores

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

Example for Innov PA powder

*Characterization of porosity
by Xray tomography*

Position of the part in the
build tank

Tomographic sections

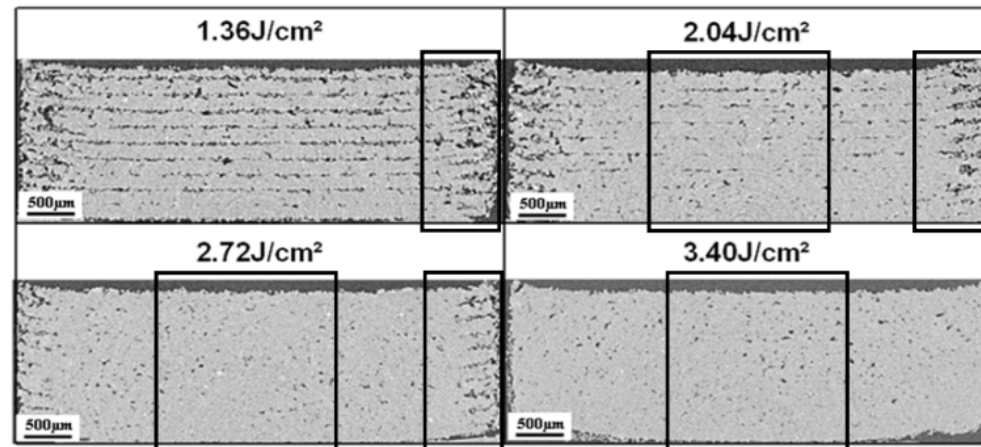

Position of the part
during analysis

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

INFLUENCE OF ENERGY DENSITY ED ON POROSITY

Example for Innov PA powder

- LOW ED: bad welding between layers
- Observation of the 2 types of porosity: open and closed

INTERPRETATION OF PART ANISOTROPY

- Porosity is concentrated at the interface between successive layers
- This is mostly noticeable at low ED, but still present at high ED

Mechanical properties are anisotropic

DENSIFICATION PARAMETERS

During sintering 2 stages occur : Coalescence and melt densification

- Evolution of the particles during coalescence : Frenkel's model

$$\frac{x}{a} = \left(\frac{3 \Gamma t}{2 \eta a} \right)^{1/2}$$

With η : viscosity
 Γ : surface tension

- Melt densification is due to diffusion/dissolution of gases from pores

➡ **Final microstructure is governed by:**

- ☐ Granular characteristics which impact powder bed density
- ☐ Melt viscosity
- ☐ Crystallization temperature (and build tank T° during process)

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

CHARACTERIZATION OF MICROSTRUCTURE – 2) CRYSTAL WEIGHT FRACTION AND RECRYSTALLIZED PHASE

DSC shows the presence of both
recrystallized and nascent fractions

Recrystallised fraction (fr) can be
calculated by a deconvolution
method:

*Source: D. Jauffres et al, Polymer 48,
6375-6383, 2007*

$$fr = \frac{\Delta H_R X_{CN}}{\Delta H_R X_{CN} + \Delta H_N X_{CR}}$$

With ΔH_R : recrystallized phase enthalpy of fusion

ΔH_N : nascent phase enthalpy

X_{CN} : nascent crystal weight fraction (50%)

X_{CR} : recrystallized phase crystal weight
fraction (30%)

Objective:

measure the evolution of fr and Xc with ED

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

INFLUENCE OF THE ENERGY PROVIDED BY THE LASER ON PARTICLE MELTING AND CONSOLIDATION

- Strong increase of f_r up to $\approx 2.5 J/cm^2$ then stabilizes
- Occurrence of nascent particles between successive layers
- From ED $\approx 2 J/cm^2$, no more nascent particles in the core of parts, but still present at the surface

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

INFLUENCE OF THE PROCESSING WINDOW

Comparison between InnovPA and DuraformPA

Build tank $T^o = 150^{\circ}\text{C}$

Crystallization T^o measured by DSC at $10^{\circ}\text{C}/\text{min}$:

Innov PA $T_c = 151^{\circ}\text{C}$ / Duraform PA $T_c = 147^{\circ}\text{C}$

Crystalline fraction measured by DSC:

► $X_c \downarrow$ when ED \uparrow
because more nascent
polymer is melted

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

Comparison between InnovPA and DuraformPA

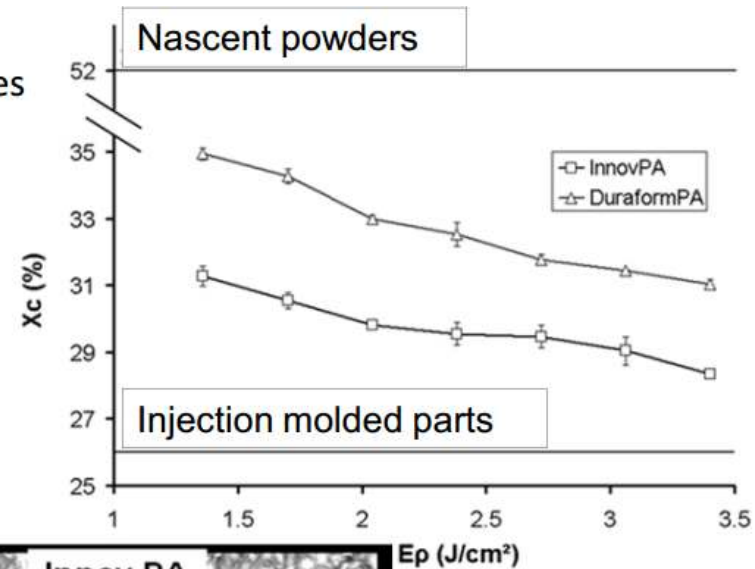

Build tank $T^o = 150^oC$

Crystallization T^o measured by DSC at $10^oC/min$:

Innov PA $T_c = 151^oC$ / Duraform PA $T_c = 147^oC$

► X_c lower for Innov PA samples

lower T_c for Duraform PA
→ slower crystallization,
larger crystalline ratio

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

CONCLUSION ON FORMATION OF POROUS AND CRYSTALLINE MICROSTRUCTURE

- Powder bed density (granulometry and morphology of powders)
 ➡ strong impact on porosity formation
- Time spent in molten state (also depends on T° of build tank)
 ➡ strong influence on porosity and on final crystalline microstructure

Porosity can be also influenced by viscosity (coalescence)

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

RELATIONS BETWEEN MECHANICAL PROPERTIES (TENSILE) AND MICROSTRUCTURE

Elongation at break is one of the most critical features of sintered polymer parts

General trend : when ED \nearrow ,
ductility \nearrow because $X_c \searrow$

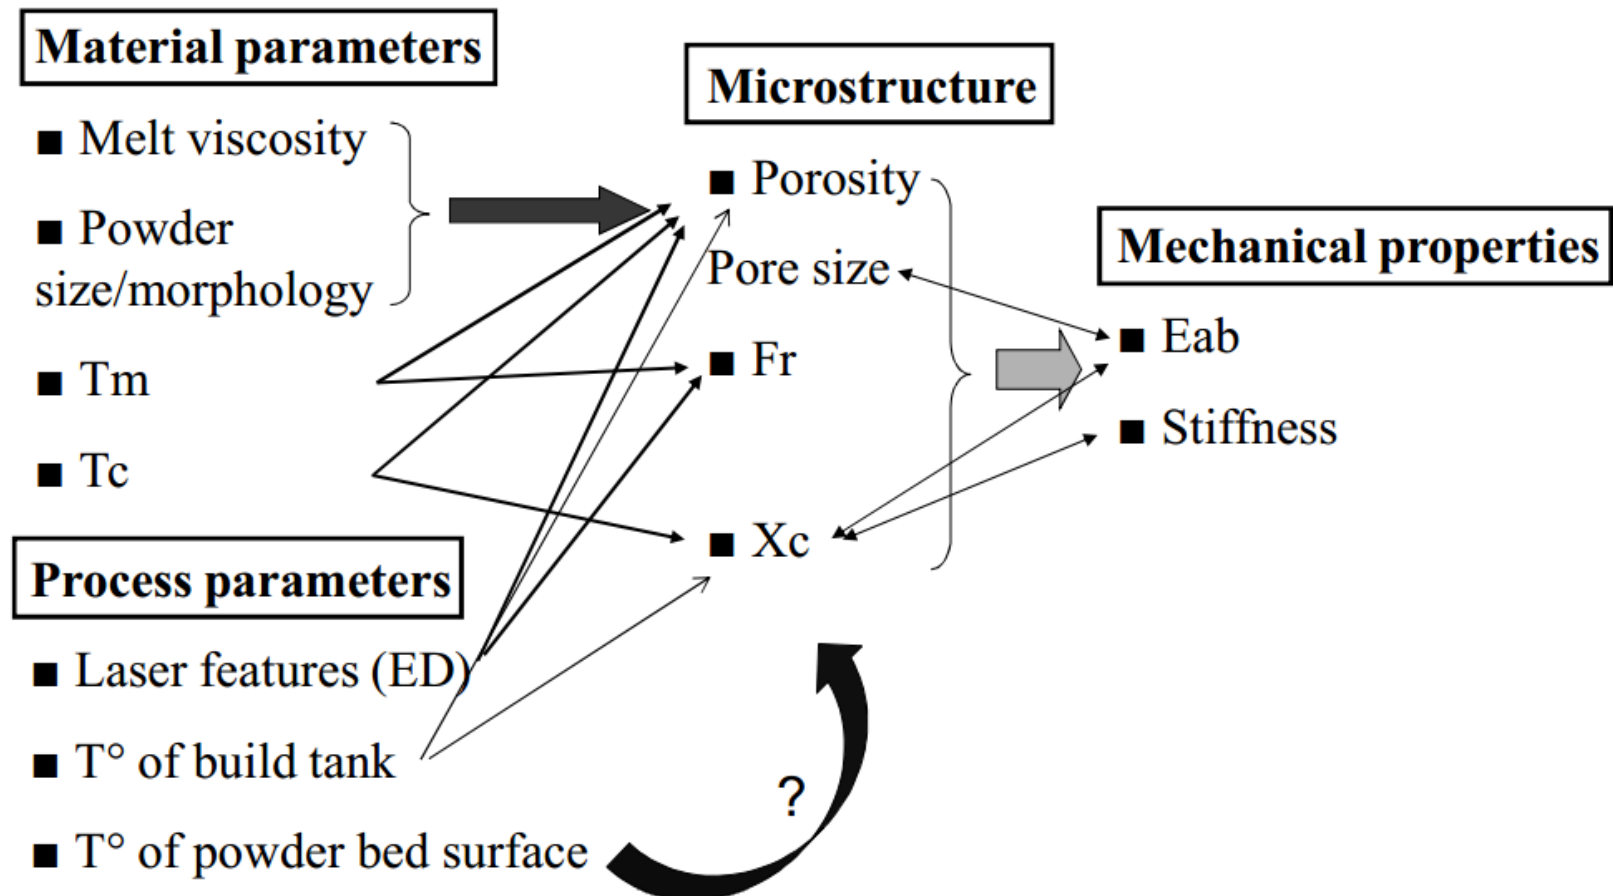

But relations are more complex

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

CONCLUSION

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

SMS – Selective Mask Sintering by IR flashing

powder
spreading

printing

flashing

repeat cycle

Principles of sintering by IR flashing through a mask **Patent owned by Sintermask GmbH, Parsberg, Germany**

- Each section (slice) is sintered as a whole by IR flashing through a mask which is regenerated for each layer
- Potentially faster than SLS
- Size part less limited
- Present technological issue : mask generation
- Process still in development

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

SMS-IR flashing : Lab-built prototype machine at INSA

- Manually operated, but automatization in project
- Can be equipped with thermocouples for T° monitoring during sintering

EASTERN MACEDONIA AND THRACE INSTITUTE OF TECHNOLOGY

Temperature monitoring in lab-IR machine
(here 3 thermocouples inserted)

Comparison with numerical simulation

EASTERN MACEDONIA AND THRACE
INSTITUTE OF TECHNOLOGY

Some features of polymer sintering processes

A few orders of magnitude :

Maximum build velocities : SLS : ~ 25 mm/h (small area)

IR-SMS : 35 mm/h , 10 to 20 s / layer, 5s target

Cooling time ~ fabrication time

Nb of powder re-uses : ~ 7 times, mixed with « fresher » powder (e.g. 50% from feed tanks, 50% from build tank, or 75% used + 25% fresh)

Layer thickness : ~ 100 μm

Minimum wall thickness : ~ 300 – 500 μm

Diameter of laser beam : 250 μm

Material cost : 50 - 150 Euros/kg
